

## Highlights:

- ❖ The Munro property is largely unexplored, with potential still remaining for discovery with numerous gold showings being reported and recorded on the property.
- ❖ An airborne geophysical survey was completed in June of 2011, which will assist in identifying areas of interest for future exploration.
- ❖ Structures on the Munro property continue from known existing gold mineralized structures that are currently being mined by Claude Resources.
- ❖ 7 km from the Seabee mine/mill complex.

## Project Plan:

The Company will initiate a field work program based on interpretation of the airborne geophysical survey and previous exploration which was completed to date.
